LAMARRE, GUY J

ART UNIT PAPER NUMBER

2133

DATE MAILED: 05/17/2002

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

09/695,756

Applicant(s)

VOSHEL

Examiner

Guy J. Lamarre, P.E.

Art Unit

2133

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 11 March 2002.
- 2a) ☐ This action is FINAL. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 41-67 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 41-67 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on _____ is: a) ☐ approved b) ☐ disapproved by the Examiner.
- If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
- a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) _____.
- 4) ☐ Interview Summary (PTO-413) Paper No(s). _____.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____.

DETAILED ACTION

Response to Amendment

0. This office action is in response to Applicants' **Amendment**, filed on 11 March 2002.
- 0.1 Claims 41-67 remain pending.
- 0.2 The rejections of record to Claims 41-43, 45-48, 54-64 stand maintained in response to Applicants' **Amendment**, filed on 11 March 2002.
- 0.3 The indicated allowability of Claims 44, 49-53, 65-67, as set forth in the office action of 01/16/2002, is withdrawn in view of newly discovered prior art references. The delay in citation of such references is regretted. The rejection to Claims 44, 49-53, 65-67 under 35 U.S.C. 103(a) based on some of the newly discovered prior art references is as follows.

Response to Arguments

1. Applicants' arguments, filed on 11 March 2002, have been fully considered but they are not persuasive.

REMARKS

- 2.0 In response to claims 41 and 45, Applicants argue that **Tsukakoshi**'s teachings are of no relevance to the claimed invention and that such teachings do not disclose procedures comprising: comparing address means including compressed format features, replacement or substitution or allocation means based on result of said comparison.

Examiner disagrees as such recitations are clearly disclosed in SUMMARY OF THE INVENTION or in col. 2 lines 35-50, e.g., “ *The memory fault analysis apparatus of the present invention is provided with an algorithmic pattern generator which generates address signals for selecting a memory cell of a memory to be analyzed, and that has a redundancy circuit and generates data which is written to a selected memory cell; a comparison means performs read after data has been written to a selected memory cell by address signals and then*

compares the read data and data from an algorithmic pattern generator to determine whether or not it is in agreement. If it is not in agreement a fault signal which indicates that the memory cell is faulty is generated. An address allocation means receives address signals from an algorithmic pattern generator and performs address allocation for a fault analysis memory so that a plural number of memory cells of a memory under test (MUT) correspond based on a predetermined rule to a single memory cell of a fault analysis memory. The fault analysis memory writes fault information in to a memory cell corresponding to a memory cell of the memory under test which has the fault, when fault signals indicating the fault are sent from the comparison means. According to the memory fault analysis apparatus of the present invention and having the configuration described above, the address allocation means performs address allocation, that is, address compression for the fault analysis memory so that a plural number of memory cells of the MUT correspond on the basis of a predetermined rule to one of the memory cells of the fault analysis memory, when at least one memory cell of the plural number of memory cells is faulty, there is the write of fault information to the memory cell corresponding to the fault analysis memory. By performing address compression, the size of the area necessary for the FAM becomes smaller than that required in the conventional apparatus and by this it is possible to reduce the judgment time for fault recovery.”

In other words, when memory cell is determined as defective, means is provided for substitution of address of said memory cell with a different address of non-faulty memory cell.

2.1 In response to claims 42-43, 46-48, 54-64, Applicants also allege that neither **Tsukakoshi** nor **Hoang** teach the invention as claimed, and that the base claims are allowable.

Examiner disagrees as **Tsukakoshi** and **Hoang** clearly disclose the limitations as claimed. Examiner maintains that the base claims are not allowable in their present form.

Art Unit: 2133

Claim Rejections - 35 USC ' 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3.1 **Claims 44, 49-53, 65-67** is/are rejected under 35 U.S.C. 103(a) as being unpatentable over **Tsukakoshi** (US Patent No. 5,363,382; Nov. 13, 1991) in view of **Meaden** (US Patent No. 4,642,793; March 19, 1984).

As per **Claims 44, 49-53, 65-67**, **Tsukakoshi** substantially discloses the procedure for the claimed method of claim 42. **Not specifically described** in detail in **Tsukakoshi** is the step whereby calculating a value from the memory address comprises dividing the value represented by the memory address by a prime number or use of hashing code or function.

However such memory address generation approach is well known in data compression. For example, **Meaden**, in an analogous art, discloses algorithms in "*Many-to-one mapping hash address generator*" wherein such techniques are described. {See **Meaden**, Id., Abstract.} **Therefore**, it would have been obvious to a person having ordinary skill in the art at the time the invention was made to modify the procedure of **Tsukakoshi** by including therein address generation means via prime numbers or hashing code or function as taught by **Meaden**, because such modification would provide the procedure disclosed in **Tsukakoshi** with a technique whereby "*The indicator R is also applied to the address input of a random access memory 37 having four locations, each of which contains a prime number in the range 3-251. The contents of the addressed location of the memory 37 supply the hashing key K for the hash coding circuit 30.*" {See **Meaden**, col. 3 line 27 et seq.}

3.1.1 **Claims 44, 49-53, 65-67** is/are rejected under 35 U.S.C. 103(a) as being unpatentable over **Tsukakoshi** (US Patent No. 5,363,382; Nov. 13, 1991) in view of **Matsuda** (US Patent No. 5,659,737; August 1, 1995).

As per Claims 44, 49-53, 65-67, Tsukakoshi substantially discloses the procedure for the claimed method of claim 42. Not specifically described in detail in Tsukakoshi is the step whereby calculating a value from the memory address comprises dividing the value represented by the memory address by a prime number or use of hashing code or function.

However such memory address generation approach is well known in data compression. For example, Matsuda, in an analogous art, discloses algorithms in *"Methods and apparatus for data compression that preserves order by using failure greater than and failure less than tokens"* wherein such techniques are described. {See Matsuda, Id., Abstract.} Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention was made to modify the procedure of Tsukakoshi by including therein address generation means via prime numbers or hashing code or function as taught by Matsuda, because such modification would provide the procedure disclosed in Tsukakoshi with a technique whereby *"FIG. 2 conceptually illustrates a mapping of predictive substrings, PS, from the character string 105 into the hash table 110. As shown by the lines and arrows in FIG. 2, for each predictive substring (PS), a hash index, specified by a hash function, maps the (PS) into an entry in the hash table 110. For the example shown in FIG. 2, the predictive substring (PS.sub.i) containing the characters "ABC" maps into a hash table entry for storage of the successive character "D." Similarly, for the additional substrings (PS.sub.i+1, PS.sub.i+2, and PS.sub.i+3), each predictive substring maps into the hash table 110. These examples assume that the natural language indications properly predict the successive character. The order of the characters in hash table 110 is merely exemplary, and the actual storage of characters is based on the hash function. Any hash based predictive function may be used in conjunction with the present invention to map the predictive substrings into the entries of hash table 110. In one*

Art Unit: 2133

embodiment, a remainder of division technique is used. The remainder of division technique is defined by the function $h(\text{key}) = \text{key} \text{ MOD } M$ where the divisor M determines the effective size of the hash table and is a prime number. The key is defined as the predictive substring. The remainder of division hash function works well when the block size is relatively small, such as when the block size is 3.” {See Matsuda, col. 2 line 56 et seq.}

3.1.2 Claims 44, 49-53, 65-67 are rejected under 35 U.S.C. 103(a) as being unpatentable over **Tsukakoshi** (US Patent No. 5,363,382; Nov. 13, 1991) in view of **NN8806199** (Improved Hash and Index Searching Techniques for Computers Using a Cache And/Or Virtual Memory; IBM Technical Disclosure Bulletin, June 1988, US; VOLUME NUMBER: 31, PAGE NUMBER: 199 – 202, hereinafter **IBM Tech**).

As per Claims 44, 49-53, 65-67, **Tsukakoshi** substantially discloses the procedure for the claimed method of claim 42. **Not specifically described** in detail in **Tsukakoshi** is the step whereby calculating a value from the memory address comprises dividing the value represented by the memory address by a prime number or use of hashing code or function.

However such memory address generation approach is well known in data compression. For example, **IBM Tech**, in an analogous art, discloses algorithms wherein such techniques are described. {See **IBM Tech**, Id., Abstract.} **Therefore**, it would have been obvious to a person having ordinary skill in the art at the time the invention was made to modify the procedure of **Tsukakoshi** by including therein address generation means via prime numbers or hashing code or function as taught by **IBM Tech**, because such modification would provide the procedure disclosed in **Tsukakoshi** with a technique whereby “*many subsets of the chained blocks are arranged so that they are contained in the same memory segment and their relative order is maintained. The standard index table contains an entry for each block comprising the array. The modified indexing table contains an entry for each memory segment that contains a logically contiguous subset of the chained blocks. In addition, each table entry contains a count of the number of blocks mapped by the entry, that is, the number of blocks contained*

within the memory segment indicated by the entry. If many blocks fit within a single memory segment, each entry in the indexing table may indicate several blocks instead of just one. This table is more compact than a general index that pointed to each block and therefore will cause less page and cache faults, in addition to occupying less memory. The modified indexing structure is shown in Fig. 3. The same set of blocks as used in Fig. 2 are modified into a smaller indexing table.” {See IBM Tech, last 10 lines.}

Conclusion

5.1 The prior art made of record and relied upon is considered to applicant's disclosure. The references cited in Form PTO-892 are for the Applicant's review and comments.

5.2 Any response to this action should be mailed to:

Commissioner of Patents and Trademarks, Washington, D.C. 20231

or faxed to:

(703) 746-7238, (for After-Final communications),

(703) 746-7239, (for formal communications intended for entry),

(703) 746-7240 (for informal or draft communications, please label

"PROPOSED" or "DRAFT").

Hand-delivered responses should be brought to Crystal Park II, 2121 Crystal Drive, Arlington, VA, Fourth Floor (Receptionist).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Guy J. Lamarre, P.E., whose telephone number is (703) 305-0755. The examiner can normally be reached on Monday to Friday from 9:30 AM to 6:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Albert De Cady, can be reached on (703) 305-9595.

Art Unit: 2133

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Group receptionist whose telephone number is (703) 305-3900.
